Read the passage carefully and answer Questions 1 to 5: The Western Ghats, also known as the Sahyadri mountain range, is a mountain range that covers an area of 160,000 square kilometres in a stretch parallel to the western coast of the Indian peninsula. It is recognized as one of the world's eight 'hottest hotspots' of biological diversity. The Western Ghats act as a key geographic barrier affecting the monsoon weather pattern across South Asia. They intercept the moisture-laden monsoon winds blowing from the Arabian Sea, resulting in heavy rainfall along the western slopes. Major rivers like the Godavari, Krishna, and Kaveri originate in these mountains and flow eastward into the Bay of Bengal. The mountain range is home to thousands of flowering plant species, hundreds of rare bird species, and endangered wildlife such as the Lion-tailed Macaque and the Nilgiri Tahr. Conservation of this ecologically sensitive region is vital to ensuring water security and climate stability for Southern India.
